

Logic: A logic must be defined by the semantics or meaning of a fact (or sentence) ^{expression}. The semantics defines the truth of each sentence with respect to each possible world.

e.g., " $x + y = 4$ " is true if $x = 1$ and $y = 3$ } $x = 2$ and $y = 2$ } $x = 3$ and $y = 1$

false if $x = 1$ and $y = 2$ } $x = 1$ and $y = 1$

In standard logic every logic must be either true or false. There is no in between.

$\alpha \models \beta$ iff $M(\alpha) \subseteq M(\beta)$ β follows logically from another α .

Agent

11	12	13	14
---	G	SSSS Strench	
21	22	23	24
---	---	---	---
31 SSSS Strench	32	33 G	34
41 G	42	43 SSSS Strench	44

KB: There are ~~some~~ "Gold Coins" and ~~some~~ "Strenches" in some of the ~~grid~~ squares.

G : There are "gold Coin" in ~~some~~ squares $[1,2]$, $[3,3]$ and $[4,1]$

G^F : There are gold coin in squares $[1,1]$, $[1,3]$, and $[1,4]$

S : There are Strench in squares $[1,3]$, $[3,1]$ and $[4,3]$

S^F : There are Strench in squares $[1,1]$, $[1,3]$ and $[1,4]$

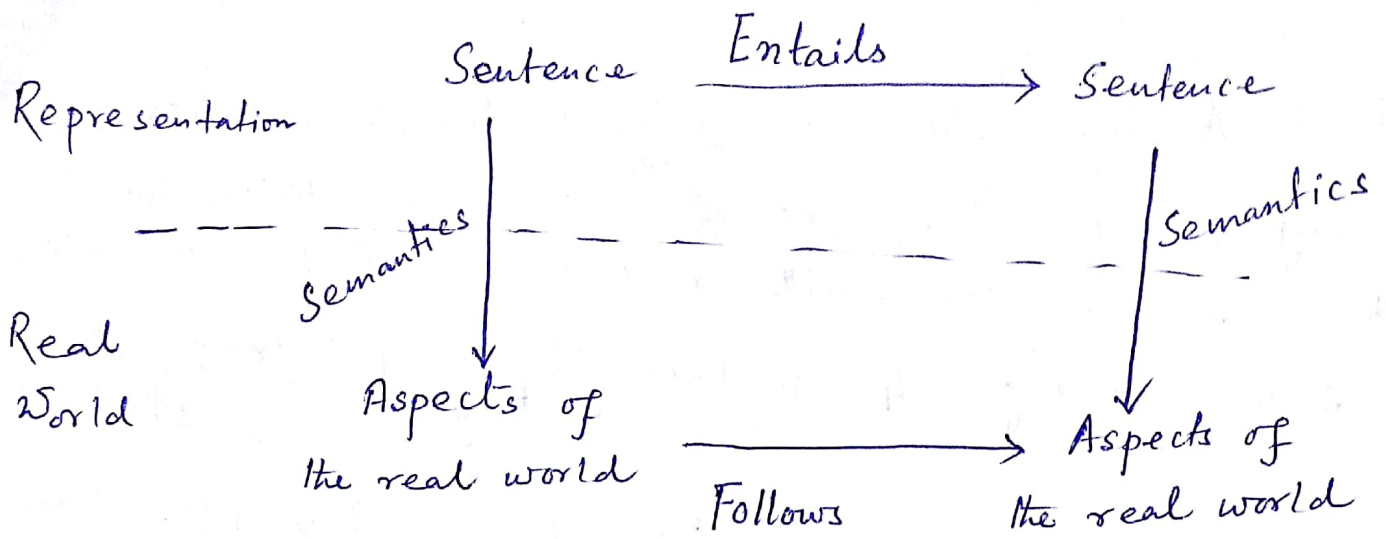

{ Hunt the Wumpus.
Pokemon

$KB \models G$ } $KB \not\models G^F$
 $KB \models S$ } $KB \not\models S^F$

Logical inference: Let α be an inference algorithm i can derived from KB by i . This is known as logical inference.

$KB \vdash_i \alpha$

$(KB) \rightarrow [i] \rightarrow (\alpha)$

How do we know that KB is true?

KB is created as per some referential truth. I.e., KB is considered true as per the knowledge of the real world.

Syntax: The syntax defines the allowable sentence.

Complex sentence and logical connections.

\neg (not) : Negation. A literal is either an atomic sentence (a positive literals), or a negated atomic sentence (a negative literals).

\wedge (and) : Conjunction

\vee (or) : disjunction

\Rightarrow : implies (implication)

\Leftrightarrow : biconditional (if and only if)

Property of Propositional logic:

- i) declarative language

- Semantics is based on truth relation between sentence and possible worlds.

- ii) Expressive

- Use partial information of disjunction and negation.

- iii) Compositionality

- The meaning of a sentence (facts) is the function of the meaning of its parts.

e.g., meaning of $F = F_1 \wedge F_2$

\Rightarrow meaning of F_1 and F_2

Disadvantage: In multi-objects environment each rule need to be written (design) separately.

Contextual Logic: Logical Reasoning based on the contexts of the real world.

$$A_1 \wedge A_2 \wedge \dots \wedge A_n \rightarrow C$$

$[A_1, A_2, A_3, A_4]$

Propositional Logic

No. _____

Tom is a cat

- ① $\text{cat}(\text{Tom}) \leftarrow$ Logical representation of an english sentence.

Let we represent the following fact.

"All cat has a tail"

- ② $\forall x : \text{cat}(x) \rightarrow \text{has-tail}(x).$

Now using deduction mechanism

using propositions ① & ② we can conclude

$\leftarrow \text{has-tail}(\text{Tom}).$

English Representation "Tom has a tail"
